From “price?” to a live auto-reply in 5 minutes.

A product design case study: the landing page and onboarding for an Instagram DM tool. Open source.

Small shops answer the same question all day.

Automation tools exist, but most start with an empty canvas of triggers and nodes. A shop owner replying at midnight gives up before she sees it work.

So the brief: from landing page to a working auto-reply in under five minutes.

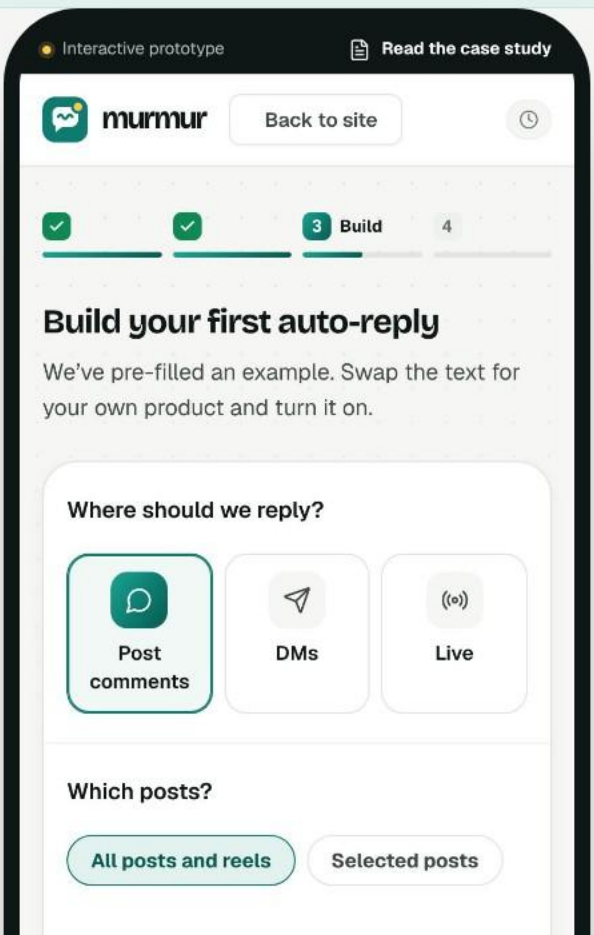

Start filled in, not empty.

PROBLEM

An empty builder asks people to design an automation before they've seen one work.

DECISION

The form opens with a realistic example. Going live means editing text, not making decisions.

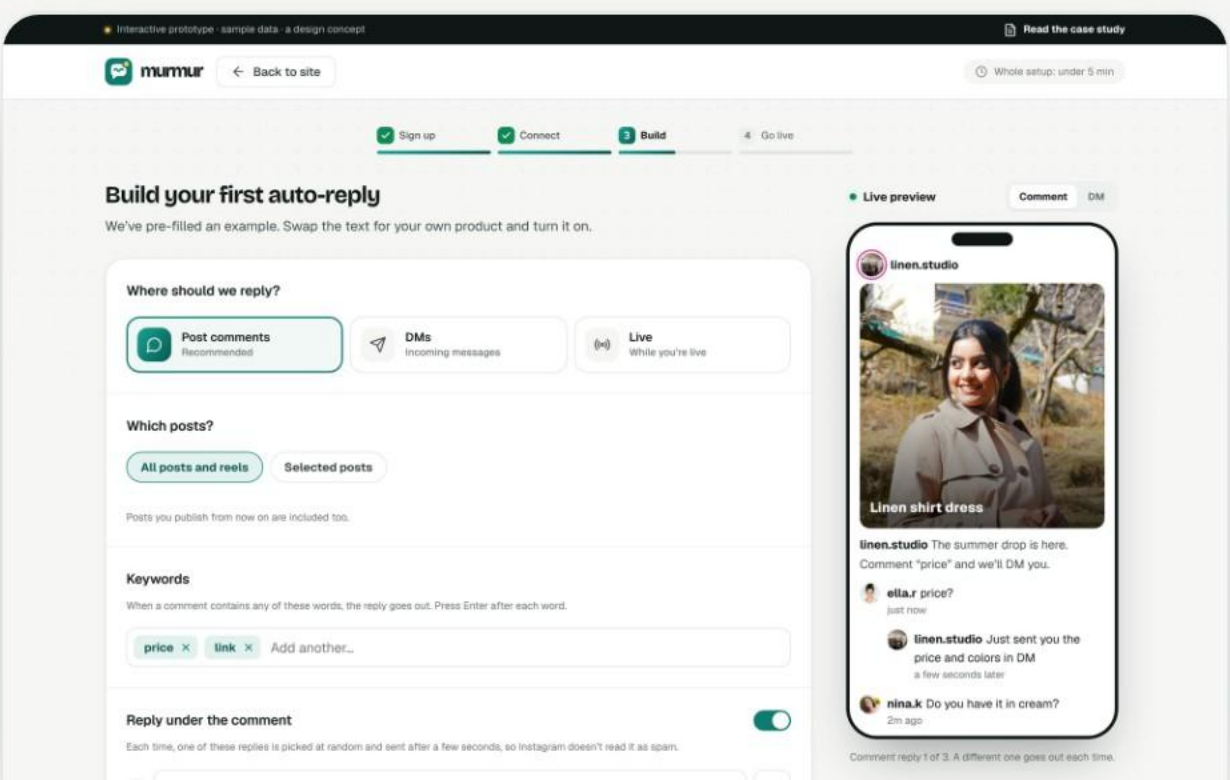

Show it, don't configure it.

PROBLEM

Settings and the customer's view live in different places, so mistakes show up in production.

DECISION

A live phone preview renders the comment or the DM as you type, and follows whatever you're editing.

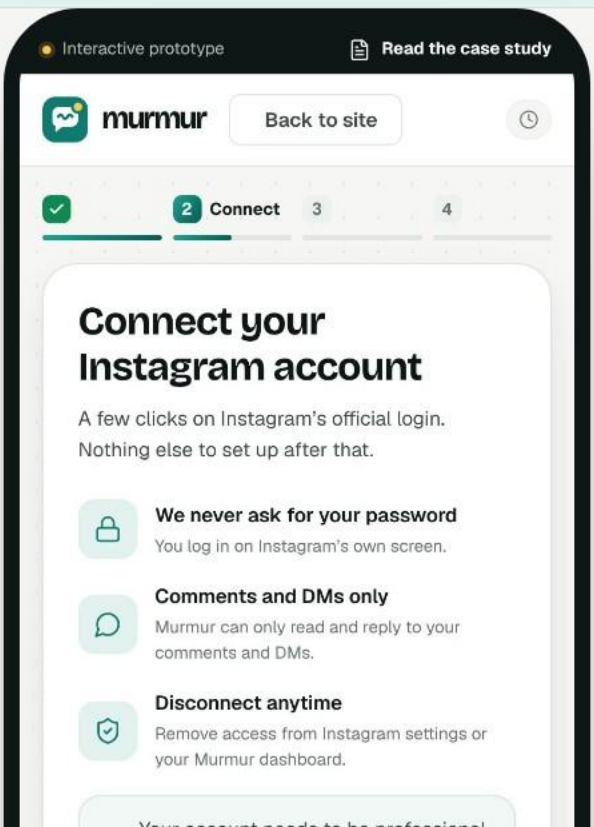

Answer the fear where it starts.

PROBLEM

“Log in with Instagram” is exactly where a cautious seller stops: will I get banned? do you get my password?

DECISION

Three short promises right next to the button, and the account requirement before it can fail.

Calm teal. One warm accent.

The category is full of blue-to-purple gradients. Teal carries every action; butter is rationed for “look here”.
